Benefits of PL/SQL
What Will I Learn?

In this lesson, you will learn to:

• List and explain the benefits of PL/SQL
• List differences between PL/SQL and other programming languages
• Give examples of how PL/SQL can be used in other Oracle products
Why Learn It?

In this lesson, you learn about the benefits of the PL/SQL programming language.

You also learn how PL/SQL compares to other programming languages.

Finally, you see how PL/SQL relates to other Oracle products.

Benefits of PL/SQL

There are many benefits of using the PL/SQL programming language with an Oracle database. We will explore each of these benefits in this lesson.

1. Integration of procedural constructs with SQL
2. Modularized program development
3. Improved performance
4. Integration with Oracle tools
5. Portability
6. Exception handling

Benefit 1: Integration of procedural constructs with SQL

The first and foremost advantage of PL/SQL is the integration of procedural constructs with SQL.

- SQL is a nonprocedural language. When you issue a SQL command, your command tells the database server what to do. However, you cannot specify how to do it.

- PL/SQL integrates control statements and conditional statements with SQL. This gives you better control of your SQL statements and their execution.

Benefit 2: Modularized program development

The basic unit in a PL/SQL program is a block. All PL/SQL programs consist of blocks. These blocks can be thought of as modules and can be “modularized” in a sequence or nested in other blocks.

Benefit 2: Modularized program development (continued)

Modularized program development has the following advantages:

• You can group logically related statements within blocks.
• You can nest blocks inside other blocks to build powerful programs.
Benefit 2: Modularized program development (continued)

- You can break your application into smaller modules. If you are designing a complex application, PL/SQL allows you to break down the application into smaller, manageable, and logically related modules.
- You can easily read, maintain, and debug the code.

Benefit 3: Improved performance

PL/SQL allows you to logically combine multiple SQL statements as one unit or block. The application can send the entire block to the database instead of sending the SQL statements one at a time. This significantly reduces the number of database calls.

Benefit 4: Integration with Oracle tools

PL/SQL is integrated in Oracle tools such as Oracle Forms Developer, Oracle Report Builder, and Application Express.

Benefit 5: Portability

PL/SQL programs can run anywhere an Oracle server runs, irrespective of the operating system and the platform. PL/SQL programs do not need to be tailored for different operating systems and platforms.

You can write portable program packages and create libraries that can be reused on Oracle databases in different environments.

Benefit 6: Exception handling

An exception is an error that occurs in the database or in a user’s program during runtime. Examples of errors include: hardware or network failures, application logic errors, data integrity errors, and so on. You can prepare for errors by writing exception handling code. Exception handling code tells your program what to do in the event of an exception.

PL/SQL allows you to handle database and program exceptions efficiently. You can define separate blocks for dealing with exceptions.

PL/SQL in Oracle Products

You can write PL/SQL code to manage application data or to manage the Oracle database itself. For example, you can write code for updating data (DML), creating data (DDL), generating reports, managing security, and so on.

Using the Web Application Toolkit, you can create database-centric Web applications written entirely or partially in PL/SQL.

Using Forms Builder and Reports Developer, Oracle’s client-side developer tools, you can build database-centric Web applications and reports that include PL/SQL.

Using a Web browser you can develop Web applications that include PL/SQL.
